Mountain Weather Forecast

Date: Sunday 10 December 2023. Location: Helvellyn summit at 12:18. Full report: Another wet and windy day in the lakes with winds near gale force over high ground. Milder temperatures over the last few days has stripped away much of the snow that arrived in the first half of last week. The highest fells still hold areas of snow, generally above 700m, and predominantly on north-facing slopes, in sheltered areas where it built up into sizable drifts. These drifts have now diminished considerably but still form a patchwork of snow that is generally easy to avoid with careful route choice. Exposed routes such as Swirral and Striding Edge require care and are a mixture of wet rock and soft snow. Microspikes are advisable, and crampons and ice axe should be carried on these and similar steep and exposed routes in case the wet snow re-freezes. It should be noted that the temperature on the top of Helvellyn today was around freezing point and snow was falling above 800m and beginning to settle. Therefore, anyone heading out tomorrow should anticipate more snow and ice than described here. Full winter clothing (waterproofs, extra warm layers, hat and gloves), and equipment including a map, compass, and a headtorch are all essential. Goggles are also recommended for navigating and route finding in challenging conditions. Temperature: plus 0.0 C, Maximum wind speed 47.3 mph, Wind chill: minus 10.7 C, Average wind speed: 35.6 mph
Issued at: 01:56 on Mon 11 Dec 2023
